IN THE SPECIFICATION:

Please amend the Title of the Invention to read as follows:

LIQUID CRYSTAL DISPLAY MONITOR HAVING AN IMPROVED STRUCTURE FOR MOUNTING A LIQUID CRYSTAL DISPLAY MODULE

Please amend the specification to read as follows:

Please amend the last paragraph on page 3 continuing on page 4 as follows:

In the TN-type active-matrix type liquid crystal display panel, when a voltage is not applied across the liquid crystal layer, the linearly polarized light entering the liquid crystal layer through the entrance-side polarizer propagates along the twist of the liquid crystal molecules of the liquid crystal layer, if the transmission axis of the exit-side polarizer is coincident with the azimuthal angle of the plane of polarization of the linearly polarized light leaving the liquid crystal layer, all the linearly polarized light exits from the liquid crystal display panel [[1]] to produce a white display (the so-called normally open mode), but, on the other hand, when a voltage is across the liquid crystal layer, a director which is a unit vector representing a direction of the average alignment of the axes of the liquid crystal molecules of the liquid crystal layer is perpendicular to the major surface of the substrate, therefore the azimuthal angle of the plane of polarization of the linearly polarized light entering the liquid crystal layer is not changed, and consequently, the azimuthal angle of the plane of polarization of the linearly polarized light leaving the liquid crystal layer becomes coincident with that of the absorption axis of the exit-side polarizer, and produces a black display. (For further detail, see "Basics and Application of Liquid Crystal," Industrial Research Association, Tokyo, 1991.).

Please amend the first full paragraph on page 40 as follows:

In the liquid crystal display monitor shown in FIGS. 7A, 7B, 8 and 9, the structures for mounting the liquid crystal display modules MDL to the monitor case CAS of the liquid crystal
